How do I read this?

: grades with less possibilities of promotion than officials with the expected average seniority in the grade. You have good merits, you have the expected seniority in the grade before promotion (more information here) but **you may not be promoted because your DG do not have enough quota**. Fast promotions are quite unlikely to happen.

: grades with an equal number of possibilities of promotion with officials with the expected average seniority in the grade. All officials with the expected seniority can be promoted. Fast promotions could happen.

: grades with more possibilities of promotion than officials with the expected average seniority in the grade. All officials with the expected seniority can be promoted and fast promotions will happen.

N.B.: DGs can marginally modify this allocation by *cascading* a promotion possibility not used in a grade to a lower grade in the same function group (AD or AST).

quotas < officials with seniority   quotas = officials with seniority   quotas > officials with seniority
